CRITICAL EVALUATION:	
<p>The solubility of hydrogen sulfide in water has been investigated by numerous workers since the nineteenth century. Some of this early work (1-3) is in good agreement with more recent work.</p> <p>Hydrogen sulfide exists, in aqueous solution, in equilibrium with its ions. Solubilities which have been compiled correspond to bulk solubilities. For this purpose the number of moles of hydrogen sulfide in solution has been taken to be the sum of the number of moles of the uncharged H₂S plus those of HS- and those of S--.</p> <p>Measurements have been made at pressures from 0.02 to 207 bar and temperatures from 273.2 to 603.2 K. The most extensive series of measurements over a pressure range were carried out by Lee & Mather (4) and by Selleck <i>et al.</i> (5). Above 344 K the mole fraction solubilities found by Lee & Mather tend to be higher than those found by Selleck <i>et al.</i> but there is better agreement at lower temperatures. However measurements indicate that, for many purposes, the mole fraction solubility can be considered to be close to a linear function of pressure to mole fraction solubilities of about 0.02. i.e. Henry's law is a useful approximation. The higher the concentration of hydrogen sulfide the greater the deviation from linear behaviour. The measurements of solubilities at partial pressures of hydrogen sulfide less than 1.013 bar made by Clarke & Glew (6) are consistent with the earlier measurements by Wright & Maass (7). When values for 298.2 K are extrapolated down to about 0.1 bar there is good agreement with solubilities measured by McLauchlan (1).</p> <p>Many values of mole fraction solubilities for a partial pressure of hydrogen sulfide of 1.013 bar (1 atm) at temperatures in the range 273.2 K to 453.2 K have been published or may be obtained by extrapolation from published solubilities (1-13). Measurements published by Kozintseva (8) are the only set of measurements made in the range 453.2 K to 603.2 K. Available values indicate that mole fraction solubilities for a partial pressure of 1.013 bar decrease with increase in temperature to about 450 K but at higher temperatures values increase. Although there is no reason to doubt the reliability of the measurements reported by Kozintseva these high temperature values must be considered to be tentative until they are confirmed by other workers.</p> <p>Mole fraction solubilities for a partial pressure of hydrogen sulfide of 1.013 bar, based upon measurements made since 1930, may be represented by the equation:</p> $\ln x_{\text{H}_2\text{S}} = -24.912 + 3477.1/(T/K) + 0.3993 \ln (T/K) + 0.015700 T/K$ <p>The standard deviation for $x_{\text{H}_2\text{S}}$ is given by:</p> $\delta x_{\text{H}_2\text{S}} = \pm 0.000065$ <p>This equation is valid for temperatures from 283.2 K to 603.2 K. The variation of $x_{\text{H}_2\text{S}}$ with T/K corresponding to this equation and the values of $x_{\text{H}_2\text{S}}$ from experimental measurements made since 1930 are plotted in fig 1.</p> <p>Values in the range 273.2 to 283.2 are better fitted by the equation:</p> $\ln x_{\text{H}_2\text{S}} = -14.761 + 2507.2/(T/K)$ $\delta x_{\text{H}_2\text{S}} = \pm 0.000030$ <p>The average value of $x_{\text{H}_2\text{S}}$ for a partial pressure of 1.013 bar at 298.15 K is 0.001830 ± 0.000007. This is based upon five sets of measurements (6,9, 11-13).</p>

AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:			
Solutions of hydrogen sulfide were prepared by dilution of a stock solution. The concentration of H ₂ S in solution was determined by iodometry. Hydrogen, generated by electrolysis of water, was passed through a solution under test. The H ₂ S in the emergent gas stream was absorbed in copper sulfate solution and estimated from the change in electrical conductivity of this solution. The partial pressure of H ₂ S was calculated from the volume of hydrogen and the total pressure of the emergent gas stream.	1. prepared from FeS.

* calculated by compiler on the assumption that dissolution of H ₂ S caused negligible change in the volume of the liquid phase.				
AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:			
A measured quantity of water was run into the a cell of known volume attached to a glass diaphragm manometer. Dissolved air was removed by repeated freezing and melting <i>in vacuo</i> . A measured amount of H ₂ S was condensed in the cell by liquid air and the cell sealed. The temperature of the cell and manometer were then controlled to 0.1 °C. P _{H₂S} was taken to be P _{total} - P _{H₂O} where P _{H₂O} is the vapor pressure of pure water. The weight of H ₂ S in the gas phase was calculated from P _{H₂S} and the volume of the gas phase. The difference between this weight and the total weight of H ₂ S used gave the weight of H ₂ S in solution.	1. From a cylinder; purified by fractional distillation as described in ref. (1). 2. Laboratory distilled and degassed.

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:
The measurements were obtained as part of a study of the complete phase behaviour of the H ₂ S/H ₂ O system. The apparatus consisted of a spherical pressure vessel from which samples of gas or liquid phases could be withdrawn for analysis. The vessel was fitted with a metal diaphragm which responded to pressure differentials. The pressure within the system was measured by a pressure balance calibrated against the vapor pressure of CO ₂ at the ice point (1).	1. prepared by hydrolysis of Al ₂ S ₃ ; dried and fractionated. 2. distilled; deaerated at low pressure.

* calculated by compiler.

[†] Henry's constant = P_{H_2S}/x_{H_2S}

$$1 \text{ atm} = 760 \text{ mmHg} = 1.01325 \text{ bar}$$

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:
<p>A special bomb, from which samples of either gas phase or liquid phase could be withdrawn, was used. The bomb was flushed with oxygen-free nitrogen, water (50 cm³) added and the apparatus saturated with H₂S (pressure not stated). The bomb and contents were then heated in a 'stirrer-furnace' to the required temperature for 25 to 50 hrs. A sample of the liquid phase was then analysed iodimetrically. A sample of the hot gas phase was passed through traps to collect the condensed water and through iodine solution. The H₂S in the hot gas phase was determined iodimetrically and the water content found from the weight of condensate.</p>	<p>No information</p>

AUXILIARY INFORMATION										
METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:									
Static equilibrium cell described in source. Vapor pressures over saturated aqueous solutions were measured with a fused quartz precision Bourdon gauge. Great care was taken to make the necessary correction for water in the vapor phase.	1. Prepared by the action of distilled water on aluminium sulfide (pure grade K and K Lab). 2. Distilled.									
ESTIMATED ERROR:										
$\delta T/K = 0.0015$; $\delta P/P = \pm 0.0002$; $\delta x_{H_2S}/x_{H_2S} = \pm 0.002$

AUXILIARY INFORMATION							
METHOD/APPARATUS/PROCEDURE:		SOURCE AND PURITY OF MATERIALS:					
A recirculating equilibrium cell was used. It consisted of a high pressure liquid level gauge and vapor reservoir. The gas phase was circulated by a magnetic pump. Samples of the liquid phase could be withdrawn. The total quantity of H ₂ S in a sample was found from the volume of gas evolved when the pressure over the sample dropped to atmospheric and the residual gas in solution, as measured by gas-liquid chromatography.		1. Matheson C.P. grade. 2. Laboratory distilled.					
ESTIMATED ERROR:

Hydrogen Sulfide in Aqueous Solvents

COMPONENTS:

1. Hydrogen sulfide; H₂S;
[7783-06-4]
2. Water; H₂O; [7732-18-5]

ORIGINAL MEASUREMENTS:

Lee, J.I.; Mather, A.E.

Ber. Bunsenges. phys. Chem.
1977, 81, 1020-1023.

(Numerical data deposited in the
National Depository of Unpublished
Data, Ottawa, Canada)*

AUXILIARY INFORMATION								
METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS:							
The H ₂ S was contained in a thermostatted metal cylinder connected to a pressure gage, vacuum pump and supply of gas. A tight fitting internal piston sealed with an O-ring fitted into the cylinder so that the volume of gas could be changed by controlled movement of the piston. A measured volume of solvent was injected into the cylinder by a syringe. The absorption of gas was found from the movement of the piston which was necessary to maintain constant pressure.	No information.							
ESTIMATED ERROR:
